1 Service Description Overview

The reject-offer service allow systems to reject contract offers made from other systems for some data in return of some amount of currency.

2 Abstract Information Model

The reject-offer service has one interface exposed which allows for systems to reject an contract. This interface is `reject`.

2.1 Reject

Reject is used to reject contract offers made by systems through the contract system. When a system rejects an offer for a piece of data in return of currency this will be relayed back to the system who offered the contract to begin with. If the input is correctly formatted the contract system will, as mentioned, relay the rejection of the contract to the system who offered it. If the input is incorrectly formatted a error will be thrown and no relay will happen. The most common reason for a rejection is that the amount of currency offered is too low.
