1 Service Description Overview

The accept-offer service allow systems to accept contract offers made from other systems for some data in return of some amount of currency.

2 Abstract Information Model

The accept-offer service has one interface exposed which allows for systems to accept an contract. This interface is `accept`.

2.1 Accept

Accept is used to accept contract offers made from systems through the contract system. When a system accepts an offer for a piece of data in return of currency this will be relayed back to the system which offered the contract to begin with. If the input is correctly formatted the contract system will, as mentioned, relay the acception of the contract to the system who offered it. If the input is incorrectly formatted an error will be thrown and no relay will happen.
